M-Enterococcus Agar Base, Modified

M-Enterococcus Agar, Modified is used for the recovery of Enterococci in water samples using membrane filter technique alongwith Esulin Iron Agar for the identification.

**Formula adjusted, standardized to suit performance parameters**

**Directions**

Suspend 71.45 grams in 1000 ml distilled water. Heat to boiling to dissolve the medium completely. Sterilize by autoclaving at 15 lbs pressure (121°C) for 15 minutes. Cool to 45°C and aseptically add 15 ml of sterile 1% TTC Solution (FD057). Mix well and pour into sterile Petri plates.

Warning: Sodium azide has a tendency to form explosive metal azides with plumbing materials. It is advisable to use enough water to flush off the disposables.

Cycloheximide is very toxic. Avoid skin contact or aerosol formation and inhalation.

**Principle And Interpretation**

M-Enterococcus Agar Base, Modified was developed for the enumeration and identification of Enterococci in sanitary quality of recreational water according to USEPA (1). Cabelli et al (2) established the correlations between enterococcal densities and gastroentitis associated with swimming in recreational waters. This medium is also useful for the detection and quantitiation of Enterococci from potable, fresh, esturine, marine and shellfish growing waters (3).

This medium contains gelatin peptone and yeast extract, which provide the carbonaceous and nitrogenous nutrients, minerals, vitamins and other growth factors. Sodium chloride maintains isotonic conditions of the medium beside the provision of essential ions to variety of organisms.

Sodium azide, Cycloheximide and Nalidixic acid inhibit large number of bacteria and fungi and thus makes the medium selective. Esclun is hydrolyzed by bacterial enzyme to esculetin and dextrose (5). TTC is reduced by Enterococci to insoluble formazan, a red coloured complex inside the bacterial cell resulting in pink to red coloured colonies.

In this membrane filter procedure, two culture media namely M-Enterococcus Agar Base, Modified and Esclun Iron Agar (M1044) are used for the enumeration and identification of Enterococci where M-Enterococcus Agar, Modified serves as a selective medium while Esclun Iron Agar (M1044) confirms the identification of colonies on the basis of ability of organisms to hydrolyze esculin. Initially the membrane filter that has been used to filter the water is placed on to M-Enterococcus Agar, Modified plate and incubated at 41°C for 48 hours and after incubation transferred to the Esclun Iron Agar plate and further incubated at 41°C for 20 minutes.

After incubation, count and record the colonies on those membrane filters containing 20 - 60 pink to red colonies with black or reddish-brown precipitate on the underside of the membrane. If required, magnification glass and fluorescent lamp may be used for counting the visible colonies. Following formula is used for the final calculation (4).
No. of enterococcal colonies
Enterococci/100ml = ----------------------------- x 100

Volume of sample filtered (ml)

**Quality Control**

**Appearance**
Cream to yellow homogeneous free flowing powder

**Gelling**
Firm, comparable with 1.5% Agar gel

**Colour and Clarity of prepared medium**
Yellow coloured clear to slightly opalescent gel forms in Petri plates.

**Reaction**
Reaction of 7.14% w/v aqueous solution at 25°C. pH : 7.1±0.2

**pH**
6.90-7.30

**Cultural Response**
M1048: Cultural characteristics observed after an incubation at 40-42°C for 48 hours with added sterile 1% TTC solution (FD057) on M-Enterococcus Agar Base, Modified (M1048) and at 40-42°C for 20 minutes on Esculin Iron Agar (M1044).

**Storage and Shelf Life**
Store below 8°C and use the freshly prepared medium. Use before expiry date on the label.
