MOX Agar

Intended Use:
Recommended for the cultivation of *Yersinia enterocolitica* from food.

**Formula adjusted, standardized to suit performance parameters

Directions

Suspend 4.4.58 (the equivalent weight of dehydrated medium per litre) grams in 1000 ml purified / distilled water. Heat to boiling with stirring to dissolve the medium completely. Sterilize by autoclaving at 15 lbs pressure (121°C) for 15 minutes. Cool to 45-50°C. Mix well and pour into sterile Petri plates.

Principle And Interpretation

*Yersinia enterocolitica*, a gram-negative coccobacillus shaped bacterium, is often isolated from clinical specimens such as wounds, faeces, sputum and mesenteric lymph nodes. It is a foodborne pathogen responsible for gastroenteritis. However, it is not a part of the normal human flora. Strains of *Y. enterocolitica* can be found in meats (pork, beef, lamb, etc.), oysters, fish, and raw milk. MOX Agar is formulated as per APHA (6) for the cultivation of *Y. enterocolitica*, a causative agent of human illness caused due to consumption of contaminated food (2).

Tryptone and soya peptone in the medium provide essential growth nutrients. Magnesium chloride and sodium oxalate enhance growth of *Y. enterocolitica*.

Aseptically collected food samples are sealed in containers to prevent dehydration, contamination in transit and to protect handlers. In case of delay, refrigeration is preferable to freezing since the latter may result in cell injury. *Yersinia* is sensitive to acid conditions, therefore acid foods and fermented products should be analyzed promptly. *Yersinia* is a psychrotroph hence cold enrichment at 4°C has been commonly used as the incubation temperature (6).

Type of specimen

Food and dairy samples

Specimen Collection and Handling:

Aseptically collected food samples are sealed in containers to prevent dehydration, contamination in transit and to protect handlers. In case of delay, refrigeration is preferable to freezing since the latter may result in cell injury. *Yersinia* is sensitive to acid conditions, therefore acid foods and fermented products should be analyzed promptly. *Yersinia* is a psychrotroph hence cold enrichment at 4°C has been commonly used as the incubation temperature (6).

Warning and Precautions:

Read the label before opening the container. Wear protective gloves/protective clothing/eye protection/ face protection. Follow good microbiological lab practices while handling specimens and culture. Standard precautions as per established guidelines should be followed while handling specimens. Safety guidelines may be referred in individual safety data sheets.

Limitations:

1. *Yersinia* is a psychrotroph hence cold enrichment at 4°C has been commonly used as the incubation temperature (1).
**Performance and Evaluation**
Performance of the medium is expected when used as per the direction on the label within the expiry period when stored at recommended temperature.

**Quality Control**

**Appearance**
Cream to yellow homogeneous free flowing powder

**Gelling**
Firm, comparable with 1.5% Agar gel

**Colour and Clarity of prepared medium**
Yellow coloured opalescent to slightly hazy gel forms in Petri plates

**Reaction**
Reaction of 4.68% w/v aqueous solution at 25°C. pH : 7.5±0.1

**pH**
7.40-7.60

**Cultural Response**
Cultural characteristics observed after an incubation at 25-30°C for 24-48 hours.

**Storage and Shelf Life**
Store between 10-30°C in a tightly closed container and the prepared medium at 20-30°C. Use before expiry date on the label. On opening, product should be properly stored dry, after tightly capping the bottle in order to prevent lump formation due to the hygroscopic nature of the product. Improper storage of the product may lead to lump formation. Store in dry ventilated area protected from extremes of temperature and sources of ignition Seal the container tightly after use. Use before expiry date on the label. Product performance is best if used within stated expiry period.

**Disposal**
User must ensure safe disposal by autoclaving and/or incineration of used or unusable preparations of this product. Follow established laboratory procedures in disposing of infectious materials and material that comes into contact with sample must be decontaminated and disposed of in accordance with current laboratory techniques (3,4).
