Pentachloro Rose Bengal Yeast Extract Agar Base (PRYES Agar)

Pentachloro Rose Bengal Yeast Extract Agar (PRYES Agar) is recommended for the cultivation and differentiation of nephrotoxin producing strains of *Penicillium viridicatum* and related species isolated from foods in accordance with APHA.

**Directions**

Suspend 190.18 grams in 1000 ml distilled water. Heat to boiling to dissolve the medium completely. Sterilize by autoclaving at 15 lbs pressure (121°C) for 15 minutes. Cool to 45-50°C and aseptically add rehydrated contents of 1 vial of Chlortetracycline Selective Supplement (FD120). If required, adjust the pH of the medium with sterile tartaric acid after autoclaving. Mix well and pour the medium into sterile Petri plates and do not invert the plates.

**Principle And Interpretation**

Mycotoxins are metabolites of fungi which may be produced during mould growth on foods and animal feeds. The most seriously contaminated commodities are cereals and oil seeds (1).

Several mycotoxins in agricultural products cause health hazards to people and animals and also economical problem. Mycotoxins are stable and are not degraded by digestion. Crops contaminated by mycotoxins due to fungal growth if ingested by animals will cause the toxin to enter the food chain. Mycotoxins vary greatly in their severity ranging from some allergic response to lethal effects.

PRYES medium was formulated by Frisvad (2) for the cultivation and differentiation of mycotoxin or nephrotoxin producing strains of *Penicillium viridicatum* and related species (3). It is also recommended by APHA (4) for the same purpose.

The medium consists of yeast extract, sucrose (YES) as the basal medium and pentachloronitrobenzene and rose bengal and hence the name PRYES. The medium is also supplemented with chloramphenicol and chlortetracycline. This combination is more effective in inhibiting bacteria than chloramphenicol alone. This medium distinguishes between producers of ochratoxin A and citrinin and producers of xanthomegnin and viomellein. Ochratoxin and citrinin-producing *Penicillium viridicatum* strains form a violet brown pigment seen on the reverse side of colony. Xanthomegnin and viomellein-producing *Penicillium cyclopium* produce a yellow pigment seen on the reverse side of the colony.

**Quality Control**

**Appearance**

Light yellow to pink homogeneous free flowing powder

**Gelling**

Firm, comparable with 2.0% Agar gel.

**Colour and Clarity of prepared medium**

Pink coloured clear to slightly opalescent gel forms in Petri plates

**Reaction**

Reaction of 19% w/v aqueous solution at 25°C. pH : 5.6±0.2
Technical Data

pH
5.40-5.80

Cultural Response
M1172: Cultural characteristics observed with added Chlortetracycline Selective Supplement (FD120), after an incubation at 25-30°C for 48-72 hours.

Organism | Growth
--- | ---
Penicillium viridicatum ATCC 10515 | luxuriant
Staphylococcus aureus ATCC 25923 | inhibited
Escherichia coli ATCC 25922 | inhibited

Storage and Shelf Life
Store between 15-25°C in tightly closed container and prepared medium at 2-8°C. Use before expiry date on the label.
