PE-2 Medium

PE-2 Medium is used for detection and cultivation of mesophilic anaerobic spore-formers in specimens collected from food processing plants.

**Composition**

<table>
<thead>
<tr>
<th>Ingredients</th>

<tbody>
<tr>
<td>Peptic digest of animal tissue</td>
<td>20.000</td>
</tr>
<tr>
<td>Yeast extract</td>
<td>3.000</td>
</tr>
<tr>
<td>Bromocresol purple</td>
<td>0.040</td>
</tr>
</tbody>
</table>

**Formula adjusted, standardized to suit performance parameters**

**Directions**

Suspend 23.04 grams in 1000 ml distilled water. Heat if necessary to dissolve the medium completely. Dispense 18-20 ml aliquots into 18 x 150 mm screw capped test tubes. Add 8-10 untreated Alaska seed peas and let the tubes stand for 1 hour to effect hydration. Sterilize by autoclaving at 15 lbs pressure (121°C) for 15 minutes.

**Principle And Interpretation**

The mesophilic spore-forming anaerobes belong to the genus *Clostridium* and are widely distributed in nature. Clostridial species are highly heat resistant and are able to grow in the absence of oxygen. Clostridial growth range covers the temperature of the normal storage of canned and other processed foods including refrigerated storage of cured meats and hence these anaerobes are important in the spoilage of low-acid foods packed in hermetically sealed containers.

PE-2 Medium is prepared as per the formulation described by Folinazzo and Troy (1) and recommended by APHA (2) for detection and cultivation of mesophilic anaerobic spore-formers in specimens from food processing plants. These organisms mainly include the genus *Clostridium*.

Peptic digest of animal tissue and yeast extract provide nitrogenous compounds, vitamin B complex and trace ingredients required for the growth of clostridia. Addition of untreated alaska seed peas creates anaerobic conditions in the medium.

Prepared samples of heated sugar, dehydrated vegetables and spices are cultured by taking 20 ml portions of these heated substances and dividing equally among 6 tubes of freshly heated culture medium. Incubate the cultures at 30-35°C for 72 hours or upto 7 days if desired as some spores germinate slowly (2).

**Quality Control**

**Appearance**

Cream to yellow homogeneous free flowing powder

**Colour and Clarity of prepared medium**

Purple coloured clear to slightly opalescent solution over alaska seeds.

**Cultural Response**

M611: Cultural characteristics observed after an incubation at 35-37°C for 18-24 hours.

**Storage and Shelf Life**

Please refer disclaimer Overleaf.
Store below 30°C in tightly closed container and the prepared medium at 2 - 8°C. Use before expiry date on the label.
